

Elements of a safety and health program

Management leadership

Creates a culture of safety, facilitates trust, and reinforces the core elements.

Worker participation

Results in a better design, implementation, and evaluation.

Hazard identification and assessment

Identifies and documents all known suspected hazards.

Hazard prevention and control

Prevents injuries using hierarchy of controls: engineering, work practices, administrative, PPE.

Education and training

Ensures all workers understand safety work practices, are familiar with hazards, and know how to participate.

Program evaluation and improvement

Assesses program effectiveness and modifications as needed.

Multi-employer worksites

Ensures communication and cooperation to protect all workers on site.
